

Exercise 3.5: Access from Outside the Cluster

You can access a Service from outside the cluster using a DNS add-on or environment variables. We will use environment variables to gain access to a Pod.

1. Begin by getting a list of the pods.

student@cp:~\$ kubectl get po

```
READY
                                STATUS RESTARTS AGE
NAME
nginx-1423793266-13p69
                      1/1
                                Running
                                        0
                                                   4m10s
nginx-1423793266-8w2nk
                      1/1
                                Running
                                        0
                                                   8m2s
nginx-1423793266-fbt4b
                                                   8m2s
                      1/1
                                Running
                                        0
```

2. Choose one of the pods and use the exec command to run **printenv** inside the pod. The following example uses the first pod listed above.

```
student@cp:~$ kubectl exec nginx-1423793266-13p69 \
-- printenv |grep KUBERNETES
```

```
KUBERNETES_SERVICE_PORT=443

KUBERNETES_SERVICE_HOST=10.96.0.1

KUBERNETES_SERVICE_PORT_HTTPS=443

KUBERNETES_PORT=tcp://10.96.0.1:443

<output_omitted>
```

3. Find and then delete the existing service for **nginx**.

student@cp:~\$ kubectl get svc

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP <none></none>	PORT(S)	AGE
kubernetes	ClusterIP	10.96.0.1		443/TCP	4h
nginx	ClusterIP	10.100.61.122		80/TCP	17m
nginx	ClusterIP	10.100.61.122	<none></none>	80/TCP	17m

4. Delete the service.

```
student@cp:~$ kubectl delete svc nginx
```

```
service "nginx" deleted
```

5. Create the service again, but this time pass the LoadBalancer type. Check to see the status and note the external ports mentioned. The output will show the External-IP as pending. Unless a provider responds with a load balancer it will continue to show as pending.

```
student@cp:~$ kubectl expose deployment nginx --type=LoadBalancer
```

```
service/nginx exposed
```

student@cp:~\$ kubectl get svc

```
NAME
             TYPE
                            CLUSTER-IP
                                             EXTERNAL-IP
                                                           PORT(S)
                                                                           AGE
kubernetes
             ClusterIP
                            10.96.0.1
                                             <none>
                                                            443/TCP
                                                                           4h
             LoadBalancer 10.104.249.102
                                             <pending>
                                                           80:32753/TCP
nginx
                                                                           6s
```

6. Open a browser on your local system, not the lab exercise node, and use the public IP of your node and node port 32753, shown in the output above. If running the labs on remote nodes like **AWS** or **GCE** use the public IP you used with PuTTY or SSH to gain access. You may be able to find the IP address using **curl**.

```
student@cp:~$ curl ifconfig.io

54.214.214.156
```

Figure 3.1: External Access via Browser

7. Scale the deployment to zero replicas. Then test the web page again. Once all pods have finished terminating accessing the web page should fail.

```
student@cp:~$ kubectl scale deployment nginx --replicas=0
```

```
deployment.apps/nginx scaled

student@cp:~$ kubectl get po

No resources found in default namespace.
```

8. Scale the deployment up to two replicas. The web page should work again.

```
student@cp:~$ kubectl scale deployment nginx --replicas=2
```

```
deployment.apps/nginx scaled
```

student@cp:~\$ kubectl get po

```
        NAME
        READY
        STATUS
        RESTARTS
        AGE

        nginx-1423793266-7x181
        1/1
        Running
        0
        6s

        nginx-1423793266-s6vcz
        1/1
        Running
        0
        6s
```

Delete the deployment to recover system resources. Note that deleting a deployment does not delete the endpoints or services.

3.5. LABS 3

student@cp:~\$ kubectl delete deployments nginx

deployment.apps "nginx" deleted

student@cp:~\$ kubectl delete svc nginx

service "nginx" deleted
